EVALUATION OF JOB SATISFACTION LEVELS OF PHYSICAL EDUCATION AND SPORTS TEACHERS IN TERMS OF SOME VARIABLES

ABSTRACT

The aim of the present research was to investigate job satisfaction levels of Physical Education and Sports Teachers in terms of various variables. For the data collection; “Minnesota Satisfaction Inventory” developed by Weiss, David, England and Lofguist (1967) and Turkish validity and reliability tests performed by Baycan (1985) and personal information form were used. 96 Physical Education and Sports Teachers who worked at state schools and private schools participated voluntarily in the research. For the statistical comparisons; “Independent-Samples T Test” and “Kruskal-Wallis” test were used during the analysis. As a conclusion of the research, it was seen that job satisfaction levels of the Physical Education and Sports Teachers did not differ in terms of sex, age, marital status and having on-job training variables. Yet, it was found out that those who worked at private schools and those who followed professional publications experienced significantly higher job satisfaction levels compared to those who worked at state schools and those who did not follow professional publications.

Key Words: Physical Education and Sports Teachers, Job Satisfaction, Minnesota Satisfaction Inventory, Primary Schools

BEDEN EĞİTİMİ VE SPOR ÖĞRETMENLERİNİN İŞ DOYUM DÜZEYLERİNİN FARKLI DEĞİŞKENLER AÇISINDAN İNCELENMESİ

INTRODUCTION

The fact that a society that is healthier, happier and productive is related to its workers' higher level of satisfaction because working life makes up one third of one's life. All of the workers demand that working conditions be better and economical, psychological and social needs about working life be met. Workers get satisfied as long as their needs are met by the institution for which they work.

Job satisfaction is the perception that one's work-related values are met by the job and that these values are consistent with the job (Akcamete et al. 2001, Basaran, 2000, Hellriegel and Slocum, 1992). Job satisfaction, one of the most important elements that make individuals happy and productive, is the satisfaction feeling created by the contributions of the job to the individual (Davis 1988, Luthans 1995, Muchinsky 2000, Musal et al. 1995, Ozgen et al. 2002).

Job satisfaction plays an important role in increasing commitment of the qualified workers for the organization and making them love their jobs (Miner 1992, Vecchio 1991) and is one of the basic elements for the individuals to be successful, happy and productive (Cam et al. 2005). It is noted that individuals with higher job satisfaction have higher organizational commitment.

Job satisfaction -described as an emotion felt by the fact that job and achievements match up with personal values and needs or as an emotion facilitated by the fact that job and achievements match up with personal values and needs (Avci and Karatepe 2000, Barutcuğil 2004, Vural, 2004)- is of much importance for teaching as well as other professions.

Teachers occupy an important place in achieving the educational objectives. Therefore, that the necessary conditions be set up and negative factors that affect their duties negatively be detected is highly important for the teachers to perform better; which increases the quality of education. It is necessary that teachers who play an important role in education should have high job satisfaction so that educational quality can be acceptable.

It is closely related to the job satisfaction of the teachers that they can perform their tasks and responsibilities charged in a successful way. It is thought that teachers who get satisfied with their jobs will have better psychological health. If their psychological conditions are better, it will be felt on their jobs, too and they will carry out their jobs voluntarily and in a productive way.

The employees want that their work have an meaning either for themselves or for others. Many employees are satisfied with thinking that they are doing an important job. It can be a job satisfaction reason if a job is interesting and gives the person opportunity to learn, and brings responsibility. As people do jobs which allow them use their talents, the jobs that require multi-faceted, and require special qualifications and if they receive feedbacks from their environment that they are successful they receive job satisfaction (Organ and Bateman, 1991; Robbins, 1998).

Physical education and sports teachers are one of the indispensable elements in general education. It needs struggle in order to be a successful physical education and sports teacher. In addition to being a trainer, the coaches are leaders that are taken as models by children (Leblanc and Dickson, 2005).

It is closely related to the job satisfaction of the physical education and sports
teacher that they can perform their tasks and responsibilities charged in a successful way. It is thought that coaches who get satisfied with their jobs will have better psychological health. If their psychological conditions are better, it will be felt on their jobs, too and they will carry out their jobs voluntarily and in a productive way.

When the effect of one’s happiness and peace at work (job satisfaction) on organizational performance and productivity had been noticed, many researches were made (Fairbrother and Warn 2002, Friday and Friday 2003, Goris 2006, Graham and Messner 1998, Lund 2003, Rossberg et al. 2004, Tietjen and Myers 1998, Uppal 2005). Although descriptive and experimental researches are based on different professional groups and variables, the questions for which answers are sought aim at increasing job satisfaction of the workers, discovering job dissatisfaction and eliminating this dissatisfaction.

For Thoms (2002); job satisfaction may be associated with both worker’s state and personal traits. It is seen that some people tend job satisfaction and—in the general sense—life satisfaction more. However, properties of the work may affect job satisfaction, too.

Physical Education and Sports Teachers, our sample group, are different from other teaching branches and have personal traits made up of some sportive dynamics. In this sense, the aim of the research was to investigate job satisfaction levels of the Physical Education and Sports Teachers who worked in Izmir Province, one of Turkey’s biggest metropolitan cities in terms of different variables.

MATERIALS AND METHODS

Participants:
The population of the research was made up of Physical Education and Sports Teachers who worked at state schools and private schools under the Directorate of National Education in Izmir Province. The sample was consisted of 100 volunteer Physical Education and Sports Teachers selected using random-sampling. 4 teachers were dropped out of the study because of data loss and the research was conducted with 96 teachers. Questionnaire forms were distributed to those who wanted to participate and they were asked whether there was something unclear and explanations were made upon their request. There was no time-limit for filling in the questionnaire forms.

Instruments:
Survey method was preferred as the data collection tool and “Minnesota Satisfaction Inventory” developed by Weiss, David, England and Lofguist (1967) and Turkish validity and reliability tests performed by Baycan (1985)- and socio-demographic data collection form were used. The inventory is consisted of 20 questions and there are five options that measure one’s job satisfaction degree. These options are “I am not satisfied at all”, “I am not satisfied”, “I am undecided”, “I am satisfied” and “I am fully satisfied”. Points are 1, 2, 3, 4 and 5 respectively. Highest score of the inventory is 100 and the lowest score is 20; if the score is 60 it is considered as neutral satisfaction. Scores that are close to 20 means lower job satisfaction whereas scores that are close to 100 means higher job satisfaction. Croanbach Alpha internal consistency coefficient is .90. Foreign researches
report that Croanbach Alpha internal consistency coefficient ranged from .82 to .92 (Erdwins et.al. 2001). Croanbach Alpha internal consistency coefficient in the present research was .91.

**Analysis of the Data:**
For the data analysis; “Independent-Samples T Test” and “Kruskal-Wallis” test were used.

**FINDINGS**

Table 1. Comparison of the job satisfaction levels of the physical education and sports teachers in terms of sex variable.

According to the Kruskal-Wallis test by which age groups and job satisfaction levels of the physical education and sport teachers were compared; job satisfaction levels of research group did not differ in terms of age variable (p>0.05).

Discussion and Conclusion

The aim of the research was to investigate job satisfaction levels of Physical Education and Sports Teachers in terms of various variables.

In light of the study findings; the most striking fact of the study was that job satisfaction level was over 80; which indicated that physical education and sports teachers of the study had high job
satisfaction levels. Alike our study, results of Göktaş (2007) 'Job Satisfaction Scale' which was carried out on the physical education teachers concluded that levels of professional satisfaction was high.

When we analyzed the findings according to the variables, it may be said that job satisfaction scores of male Physical Education and Sports Teachers were higher than female teachers. Yet, it was not statistically significant. The study of Eldred (2010) and Vélez (1993) reported that sex variable did not affect job satisfaction level.

According to Papin (2005), male and female teachers may have different views about job satisfaction. Although they get the same salary, female teachers are hierarchically at lower positions (Shultz and Shultz 1990); which is the same even in developed countries (Tezcan 1992). Female teachers who quantitatively constitute an important part of the profession prefer the teaching profession due to part time working and longer holidays (Ozdemir and Yalin 2000); which may be the factors that reduce their career wishes and job satisfaction. And also, the social role of motherhood that requires time for home and children may be influential on job satisfaction. This issue is liable to cultural changes.

It was found out that mean job satisfaction scores of the participant single physical education and sports teachers were higher than those married. Yet, it was not statistically significant. Marital status is accepted as an affecting factor on job satisfaction level. It is thought that marriage increase job satisfaction because it brings an organized life style (Yildiz et al..2003). However, it did not support our research-findings.

According to Eker (2006), career opportunity and professional development opportunities are very limited. Institutional sources are not reserved for teacher development. In addition, on-job training activities are continued in a traditional way. The majority of our participants got on-job training and job satisfaction levels of them was found –even if just a bit- to be higher than those who did not get on-job training. Yet, “on-job training variable” is not an effective factor on job satisfaction.

According to Oshagbemi (2000); as the workers grow older they become more satisfied with their jobs. Different age groups were investigated in our study. So, as the age of the participants advanced their job satisfaction decreased and job satisfaction tended to increase at the age of ≥ 50. However, job satisfaction levels of the physical education and sports teachers did not differ significantly in terms of age groups.

As the result of some scientific studies; it was noted that there was not correlation between age variable and job satisfaction of the teachers (Castillo 1999, Greenreese et al. 1991) whereas there were studies that reported that job satisfaction levels of young teachers were significantly higher (Shead 2010). Göktaş (2007), found that levels of physical education teachers’ professional satisfaction was "very satisfied" between the ages 25-30. Similar to the findings of this study, Suyunç (1998), Can and Koçak (2003) found that satisfaction levels of profession had paralleled with age and seniority level variables.

It was found out that job satisfaction levels of physical education and sport teachers who followed professional publications was significantly higher than those who did not follow professional publications. In our study-group, the rate
of the physical education and sport teachers who regularly followed professional publications was less than half (45%). It may be regarded as an expected result that those who followed professional publications had higher job satisfaction levels. These teachers may be considered as having a tendency to continually develop themselves, to increase professional experience and to be open to innovations. These results concurred with the findings of some of the researches conducted in Türkiye (Akiner 2005, Minibas 1990).

The fact that teachers who worked at private schools had higher job satisfaction levels may result from the comfortable working settings. It has long been discussed in the physical education and sport discipline that many state schools do not have indoor sport halls and suffer from insufficient sportive equipment. On the other hand; indoor sport halls, rich equipment, encouragement of school sports as a rivalry and advertisement element in private schools may be possible reasons for higher job satisfaction levels of those who work there.

As a conclusion; it was noted that job satisfaction levels of physical education and sport teachers did not differ in terms of sex, age, marital status and on-job training variables. Yet, those who worked at private schools and those who followed professional publications experienced significantly higher job satisfaction levels compared to those who worked at state schools and those who did not follow professional publications.
